Know what to *click next.*

An AI guide for the software you already use.

Sage points; you make every click.

You know the goal. *Where is the button?*

The work is clear. The next step in the software isn't.

SEARCH

Leave the task

Search documentation or scrub through a tutorial.

ASK

Explain your screen

Describe the interface to a chatbot or ask a colleague to look.

REPEAT

Get stuck again

The next menu opens. The instructions no longer match.

For a team, every repeated question can become another interruption.

Guidance stays *beside the work.*

Ask
Say what you want to do.

→

See
Sage reads the current screen.

→

Guide
It explains and points.

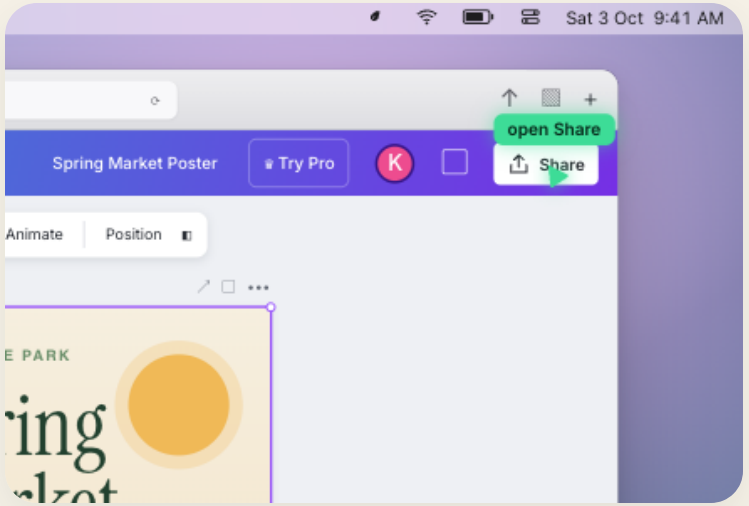

→

Click
You take each action.

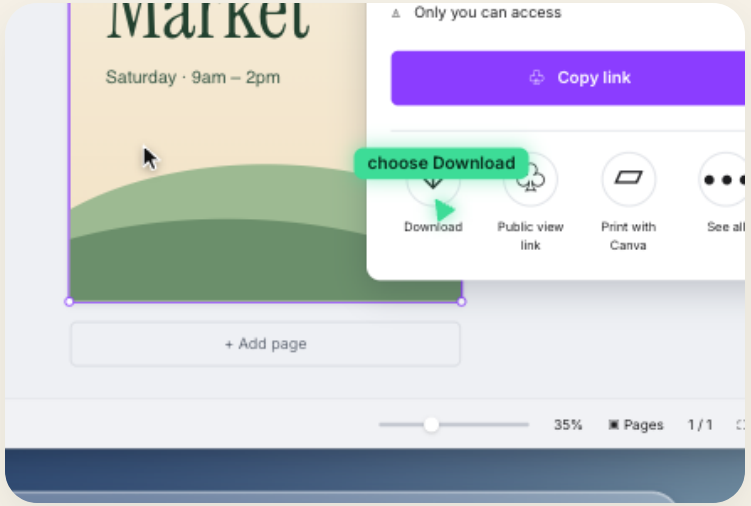

Get help without handing over control of your computer.

Screen understanding, speech, and visual overlays come together in the Mac prototype.

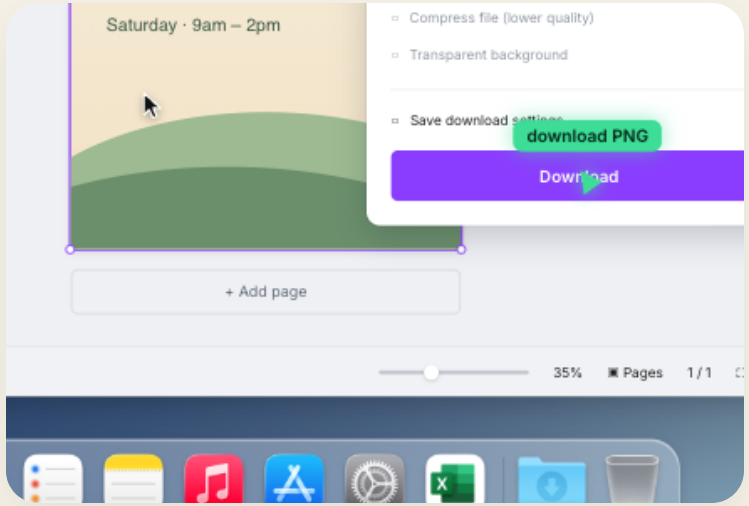

“How do I export *this as a PNG?*”

01 · Open Share

02 · Choose Download

03 · Export as PNG

Sage points. You click. It guides the next step.

Illustrated interaction from the website demo. Native-app recording is the next proof asset.

Software knowledge. *Your team's procedures.*

Built today

A guide to the interface

Voice questions, screen interpretation, spoken answers, and follow-along pointing.

Next product direction

A guide to your process

Ground guidance in approved instructions: file names, export settings, review steps, and handoffs.

The pointer is the interface. Trusted team knowledge is the advantage to build.

Start with *Mac-using agencies.*

One reachable team.
One recurring handoff.

Start with client-file preparation: export settings, naming, review, and delivery.

Initial target · teams of 10–50

Why this starting point

The existing Mac app fits the platform. File handoffs provide a bounded workflow to test.

Who buys / who uses

Owner or team lead / junior staff and contractors.

What discovery must establish

Repeated training pain, permission to process screens, and willingness to pay.

A clear place *among the alternatives.*

Chatbots & screen assistants

Strong general software help.

Our direction: approved team procedures, delivered on the live screen.

Videos & written guides

Reusable instructions outside the task.

Sage follows the user's current screen and waits for their action.

Digital-adoption platforms

Organizational guidance and deployment.

Our intended entry point: a small team and one bounded pilot.

Pointing alone is not unique. Company knowledge, reliability, and paid outcomes must earn the advantage.

Built end to end.
Ready for the next test.

Keside Onyeocha

Built Sage’s native Mac prototype, voice pipeline, screen guidance, backend, and website.

The experience brings the answer back to the interface where the user is working.

Started from the MIT-licensed Clicky project.

Next milestone

Three paying pilot teams

Capture real-app demonstrations. Interview buyers. Harden installation, privacy, accessibility, and pointing.

Test whether people finish tasks with fewer trainer interruptions.

A paid pilot. *A reason to renew.*

Pilot plan

Four weeks. Five workflows.

One team, five to ten users, and agreed success criteria.

$300–$750

initial pricing experiment

Renewal plan

A team subscription

Monthly minimum and pooled usage, priced after measuring delivery costs.

Value to test = time saved + fewer interruptions + fewer mistakes.

Measure correct task completion, trainer interventions, cost per workflow, and paid continuation.

About a cent *per question.*

Cost per question

	TODAY	PRODUCTION
Understanding Claude Sonnet 5.5	$0.007–0.01	$0.007–0.01
Hearing speech to text	Free · on Mac	≈ $0.001
Voice text to speech	Free · Mac voice	$0.003–0.01
Total	**≈ $0.01**	**≈ $0.02**

Per user per month · 22 workdays

	TODAY	PRODUCTION
Light 5 questions a day	$1.10	$2.20
Typical 15 a day	$3.30	$6.60
Heavy 40 a day	$8.80	$17.60

A ten-person, four-week pilot uses about **$70** of AI at production quality, against a $300–$750 price.

Estimates from October 2026 list prices and measured requests (≈3,300 input tokens including the screenshot, ≈300 output). Each follow-along step counts as one question. Server, website, and waitlist run on free tiers today.

Human understanding.
A human-sounding voice.

Understand people

Streaming speech recognition tuned for accents and team vocabulary.

Sound human

A natural voice you can interrupt, synced to the pointer.

Point precisely

Read the Mac's button map and on-screen text, not pixel guesses.

Ship like a product

Signed app, auto-updates, accounts, billing, crash reports.

Subscription to test

$15–$25 per user per month with fair use: ≈ 55–75% margin on a typical user.

One-time cost to production

	LEAN	COMFORTABLE
Apple Developer signing	$99	$99
Legal & registration	$0 templates	$600–1,400
Brand & build tools	$60	$500–1,100
Pilot usage buffer 3 teams · 2 months	$400	$600
Security review	Later	$1,000+
Total	**≈ $560**	**≈ $2,800–4,200**

Then ≈ $20–60 a month fixed (Apple, hosting, email) plus usage. Founder-built; hired development is not included.

Help turn the prototype *into three paid pilots.*

Help fund the next stage

Release hardening, model and voice usage, pilot onboarding, and direct customer discovery.

About **$1,000–$1,500**

a signed Mac app plus three pilots, on the lean plan with a buffer

Timeframe and agreement to be set together before any money changes hands.

Help open the right doors

Introduce agency owners, team leads, or trainers who repeatedly explain software workflows.

Help qualify pilot teams and sell a specific, measurable outcome.

The milestone: three paid pilots, measured task outcomes, and evidence of renewal.
